

Skin-specific orderings — 127 network genes × 54 GTEx tissues
(cells = τ -style row-normalized expression; tissues grouped by system)
 τ -split ($\tau \geq 0.7$ on top, $\tau < 0.7$ below)
rows within each block sorted by Welch's t

Composite: Welch's $t \times \tau$
(combines skin-enrichment and overall tissue-specificity)

Relative expression ($x / \max$ per gene)
 $\tau = \frac{\text{mean}(1 - \text{this})}{\text{across tissues}}$
